Impact of climate change on agriculture in Asia-Pacific: Convergence of food systems transformation and climate action:

Dr. Sanjay Srivastava
Chief, Disaster Risk Reduction
UN Economic and Social Commission for Asia and the Pacific

FOOD SYSTEMS TRANSFORMATION PROGRESS REVIEW

Asia and the Pacific Regional Meeting with the Food Systems National Convenors 29 April 2024 Conference Room 4, ESCAP Office, Bangkok, Thailand

Outline of presentation

Impact of climate change on agriculture

An era of climate emergency

Intersection of climate extreme and SDGs on ground?
Intensifying and expanding multi-hazard risk hotspots affecting food systems

Exposure of agriculture value under climate scenarios

Food system resilience in climate emergency

Seamless integration of weather and climate information

ESCAP Risk and Resilience Data platform to fill in gaps in information and knowledge

Key takeaways

1 An era of climate emergency

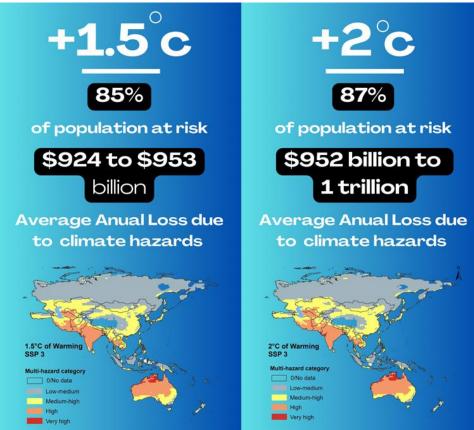

Asia-Pacific remains the most disaster impacted region.

Climate change impacts and risks are becoming increasingly complex and more difficult to manage.

Multiple climate hazards will occur simultaneously.

Climatic and non-climatic risks will interact, resulting in compounding overall risk and risks cascading across sectors and regions. (IPCC AR 6)

A <u>Riskscape@1.5</u> and 2.0 warming: Intensifying and emerging hotspots

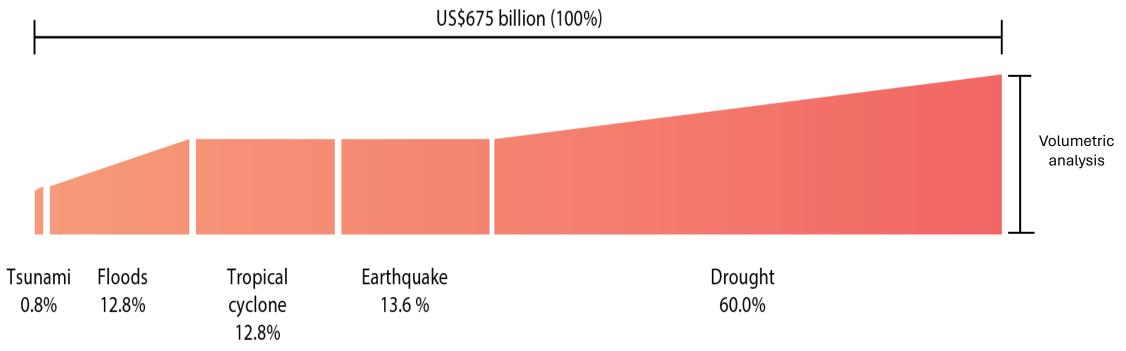

Asia-Pacific Disaster Riskscape:

Annualized economic losses USD 675 billion –around 2.4 per cent of region's GDP

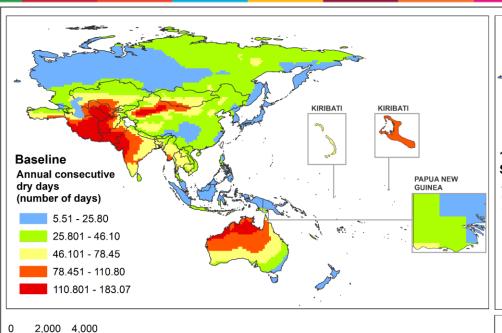

Climate risk accounts for 85 per cent of the regional 'riskscpace'

Source: ESCAP), Asia-Pacific Disaster Report 2019, Figure 1-1

Agriculture bears the brunt of climate related risk, Drought impacts, more than 80%, to agriculture/livestock

Hotspots of existing, intensifying and emerging drought risk under baseline and climate change scenarios (1.5- and 2-Degree warming)

: ESCAP calculations based on IPCC WGI Interactive Atlas - Coupled Model

2. The Annual Consecutive Dry Days refers to the maximum number of days with

Dotted line represents approximately the Line of Control in Jammu and Kashmir agreed

upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been

Intercomparison Project Phase 6 (CMIP6) 2021 and UN Geospatial.

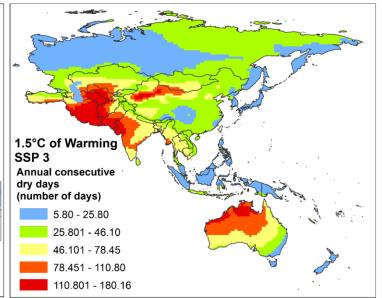

official endorsement or acceptance by the United Nations.

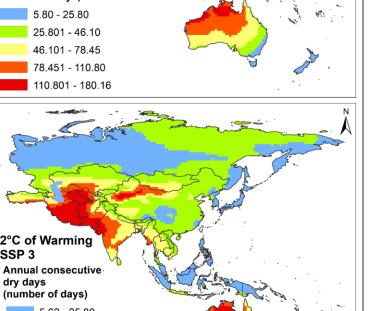

: 1. The baseline period is from 1995-2014.

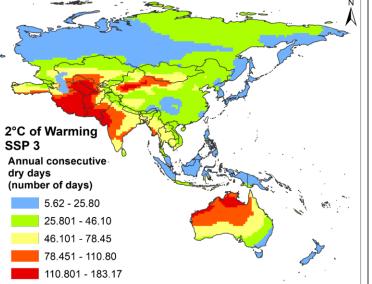

precipitation less than 1 mm.

agreed upon by the parties.

Notes

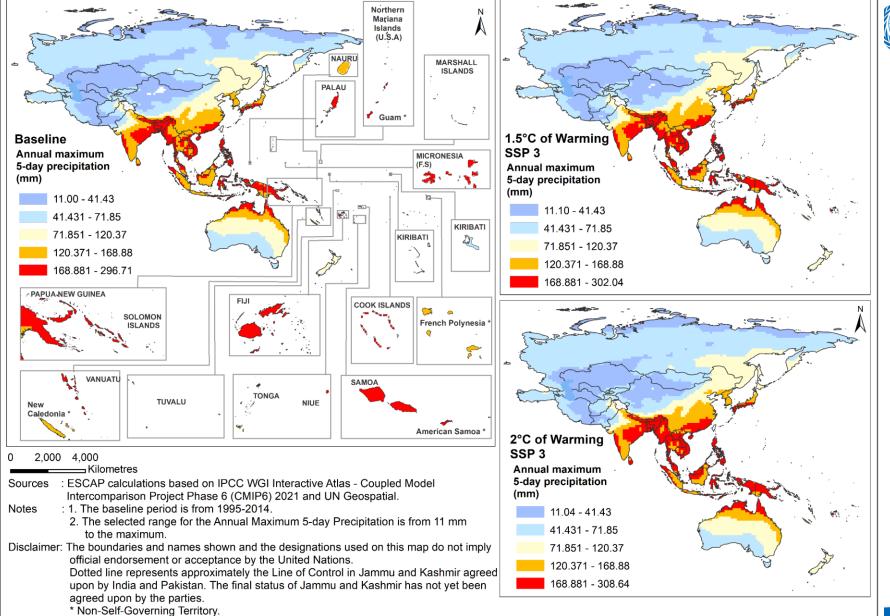

Hotspots of intensifying and emerging flood risk under scenarios (1.5- and 2-Degree warming)

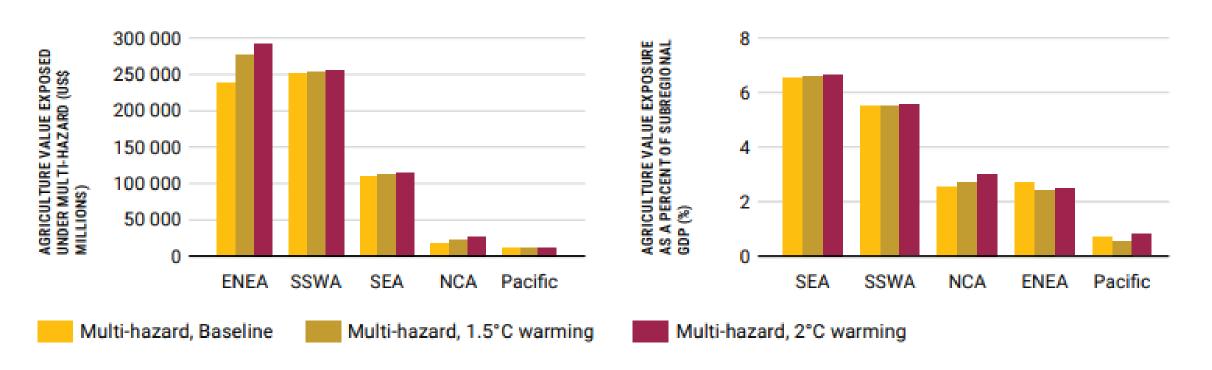

2.0 Exposure of agriculture value under climate scenarios

Under different warming scenarios, East and North-East Asia face the highest absolute value of potential agriculture loss, with over \$250 million at stake in all scenarios. South-East Asia is projected to suffer the most in terms of GDP loss, with potential agriculture losses amounting to 6 per cent of GDP. North and Central Asia and the Pacific also show increasing potential GDP losses.

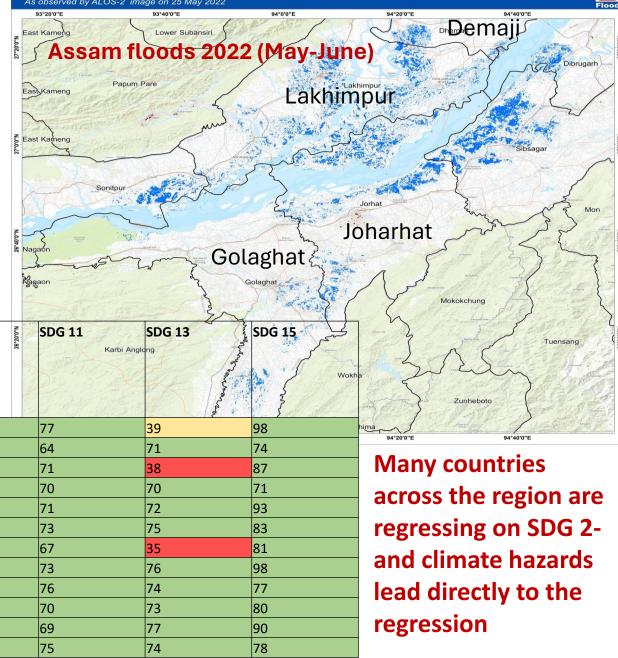

When Assam (India) floods Intersected with SDGs on ground?

Assam records one of the highest number of flood events across India (1969-2019): SDG localization reveals flood impacted districts have lowest SDGs (2, 13)

2022 Assam floods impact severely SDGs
SDGs (2/13) already low in Golaghat, Demaji, Lakhimpur, Jorhat..
Floods impacts on agriculture will affect the progress

Small and marginal farmers bear the brunt

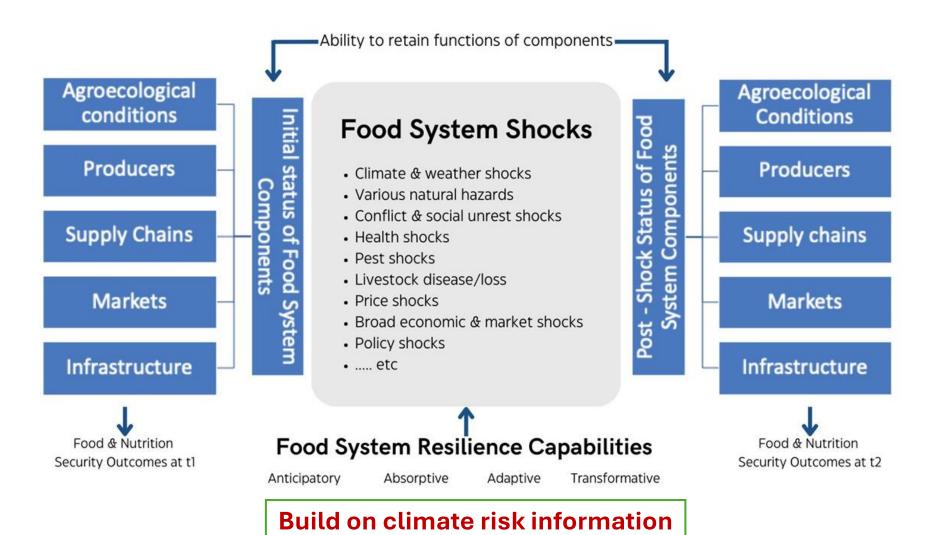

Districts	Composite SDG Score	SDG 1	SDG 2	SDG 3	SDG 9	SDG 11 Ka	SDG 13	SDG 15	
Cachar	68	56	49	60	94	77	39	98 hin	
Dhemaji	66	64	42	61	94	64	71	74	
Dibrugarh	68	64	55	59	95	71	38	87	
Golaghat	67	65	48	58	94	70	70	71	
Hailakandi	67	52	45	59	96	71	72	93	
Jorhat	70	65	47	57	96	73	75	83	
Karbi Anglong	64	50	48	61	78	67	35	81	
Karimganj	69	56	50	61	93	73	76	98	
Lakhimpur	69	68	42	63	90	76	74	77	
Nagaon	67	61	48	61	96	70	73	80	
Sibsagar	68	61	54	62	92	69	77	90	
Sonitpur	69	65	51	59	94	75	74	78	

DETECTED FLOOD WATER IN ASSAM STATE, INDIA

Food system resilience in the era of climate emergency

[FAO 2021]

Seamless integration of weather and climate information: Towards building food system resilience capacities

Few days ahead

Early warning & crisis management

Production level: drainage, pumps, adjusting harvest, planting schedule

Distribution level: advance stocking

Government level: preparation and prepositioning emergency relief stock and deployable personnel

One season ahead

Exposure reduction

Production level: informed crop variety and mix selection

Distribution level: alternative sourcing of at-risk stocks

Government level: targeted resilience building in at-risk states, districts, vulnerable communities

One year ahead

Vulnerability reduction

Production level: investment in tools and equipment, insurance policy

Distribution level: investment in refurbishing distribution centers and networks

Government level: inter-ministry coordination, anticipatory action, impact basedforecasting

Years ahead

Strategic planning & deployment

Production level: land use & crop strategy in the changing climate

Distribution level: long-term global sourcing strategy

Government level: land use planning, international collaboration, Agricultural trade policy

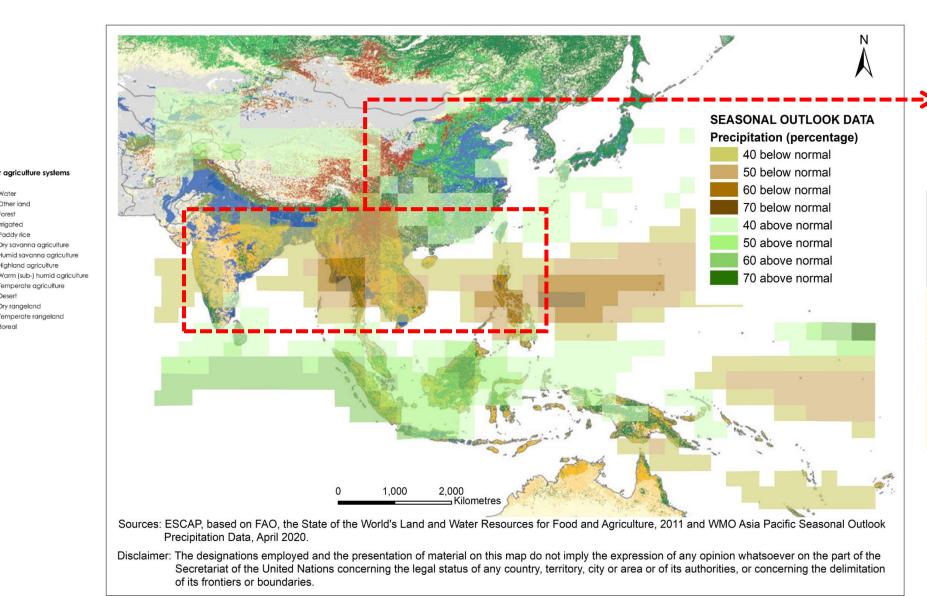

Bridging the gaps in information value chain for food system resilience: seasonal impact forecasting, climate scenarios

The Risk and Resilience
Portal, an initiative of the Asia
Pacific Disaster Resilient
Network (APDRN) brings
together risk analytics and
policy analysis under one
platform to strengthen
capacity of all stakeholders
for risk informed planning and
budgeting

Translating seasonal outlook to impact forecasting of agri-food system

Major agriculture systems

Temperate agriculture

Temperate rangeland

Major agriculture systems in Asia-Pacific exposed to below normal precipitation.

	Rice export value (2019)	share of the global total export
India	\$7.1billion	33%
Thailan d	\$4.2billion	19%
Viet Nam	\$2.6billion	12%

 2018 data for Viet Nam Data source: ITC Trade map (accessed on 6 May 2020)

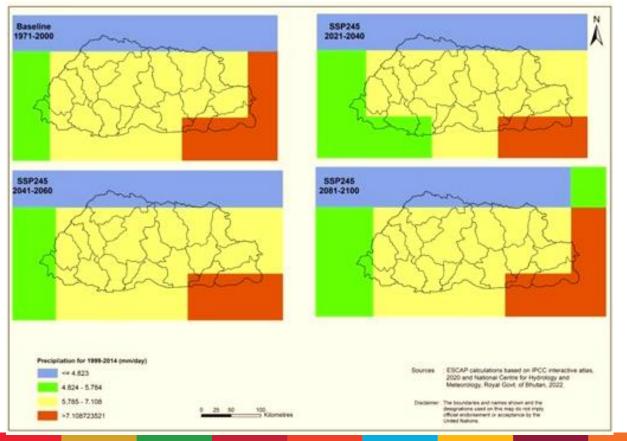

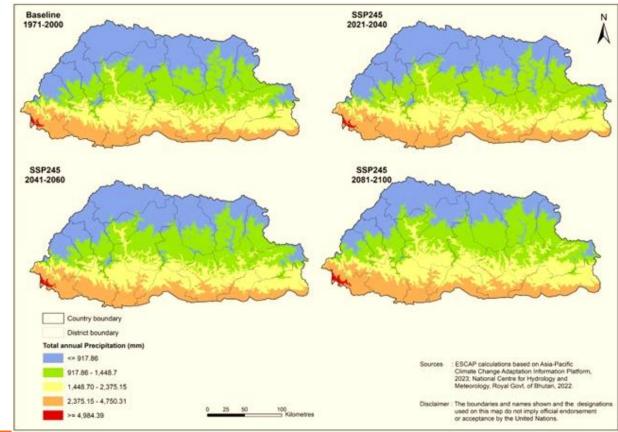

Bhutan

Downscaling risk scenario for climate resilient food system

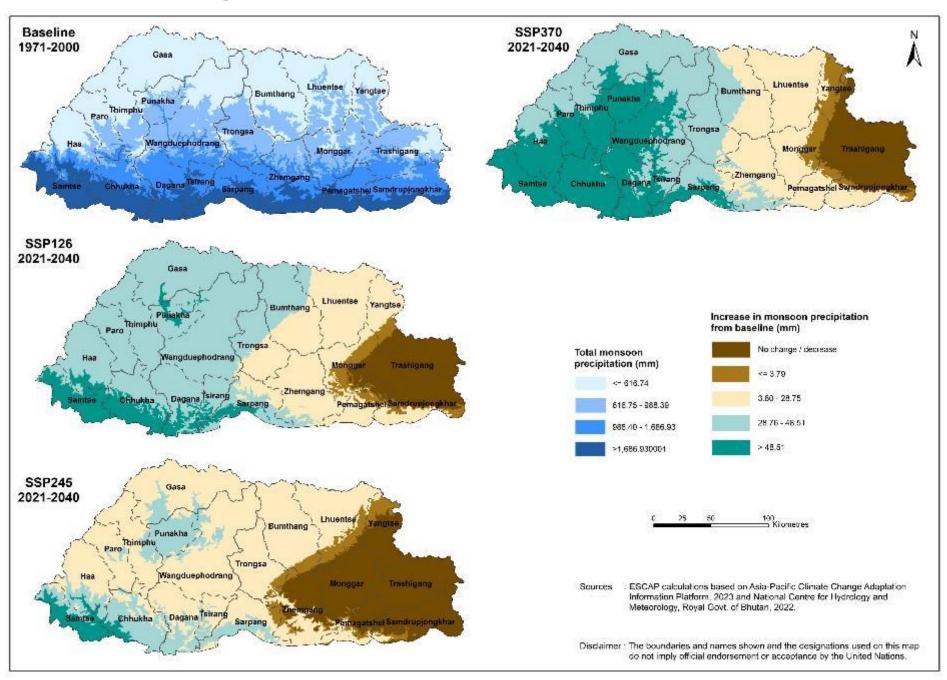

Upon request, downscale the climate data for a more granular analysis (1km resolution in Bhutan)

100km x 100km 1km x 1km

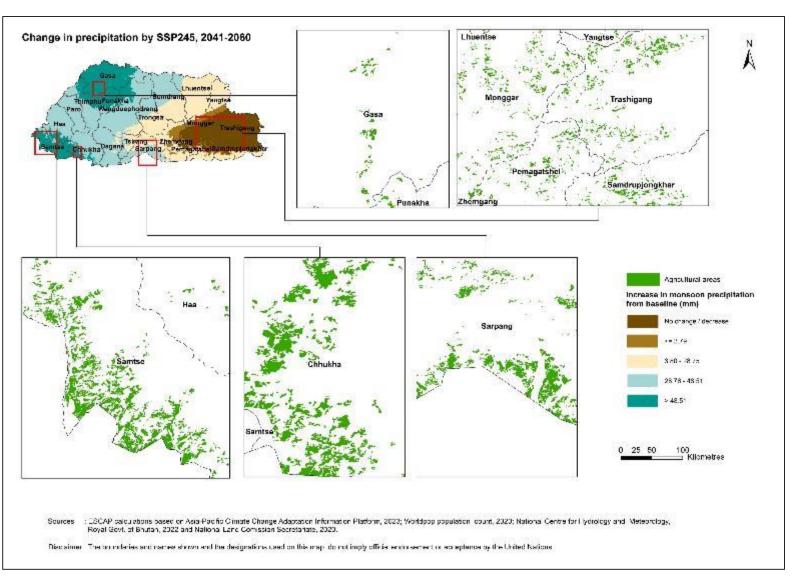

Bhutan: Change in total monsoon precipitation from baseline by 2040

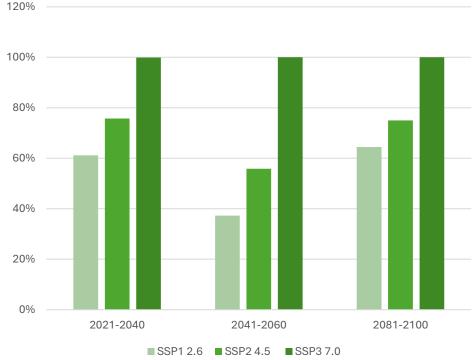

- The eastern most districts are likely to face slight decrease in monsoon precipitation
- Monsoon precipitation is likely to increase in rest of the districts by up to 100mm by 2040 under worst case scenario.
- The highest increase is likely in the central and south-western districts.
- The southern districts which receives highest rainfall in Bhutan are already flood prone.

Bhutan: Exposure of agricultural areas to change in monsoon precipitation under SSP3, 2041-2060

- Exposure of agricultural lands to high to very high increase in monsoon precipitation increases from 2021 to 2100 across all the scenario.
- Around 54% and 66% of the total agricultural areas are exposed to high increase in monsoon precipitation by 2040 and 2060 respectively under SSP3 scenario

Key takeaways #4 strategic actions

Understand the multi-hazard risk 01 hotspots of agrifood systems in diverse ecosystems Building food system 02 04 resilience in era of climate emergency Integrate climate risk information to build anticipatory, absorptive, adaptative and transformative capacities 03

Capitalize on advances in climate and data science for seamless integration of weather and climate information

Managing climate risk key to SDG 2/SDG 13 acceleration
