

Virtual Event 15-18 June 2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

A comparison of fertility measures from censuses and a civil registration and vital statistics system: The case of Republic of Korea

Action Area C. Integrated statistics for integrated analysis (SC3)

Which way now on the journey towards integrated statistics (2)?

Presenter:

Eunkoo Lee

United Nations Statistical Institute for Asia and the Pacific

Total Fertility Rate

- TFR is a basic fertility measure used to monitor the progress in women's reproductive health

$$\textit{Total fertility rate} = \sum_{\substack{x=15 \\ x = \textit{age}}}^{49} \textit{ASFR}_x \times 5$$

Virtual Event 15-18 June 2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

Data sources for calculating TFR

- Civil registration (if reliable) is the preferred data source
- Census and household survey as alternate sources

#apstatsweek2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

Two issues with period TFR

- Period TFR is underestimated when there's a delay in childbearing (tempo distortions)
- Includes all women aged 15-49 regardless of their birth history (incidence rates, rates of the second kind)

Bongaarts and Feeney tempo adjusted TFR

$$\text{BF tempo adjTFR} = \sum_i \frac{\text{TFR}_i}{1-m_i}; \text{ i=birth order i to n; m=mean age at childbearing}$$

Parity progression ratios (PPRs)

- Insensitive to tempo distortions
(based on birth order, no time dimension)
- Only includes those who have given births
(occurrence-exposure rates, rates of the first kind)

#apstatsweek2020

Virtual Event 15-18 June 2020

Leaving no one and nowhere behind

Parity progression ratios (PPRs)

$$\text{TFR}_{\text{pppr}} = p_0 + p_0 p_1 + p_0 p_1 p_2 + \dots;$$

p_i = proportion of women progressing from i th to $(i+1)$ th birth

Fertility measures from Two different types of data sources and three different methods

- TFR from CRVS
- BF tempo adjTFR from CRVS
- TFR (2000, 2005, 2010 censuses, own children method)
- TFR (2010 census, parity progression ratios)
- TFR (2015 census, parity progression ratios)

Own-children Method

$$\text{ASFR for age 24 in 1967} = \frac{B_{24}}{W_{24}}$$

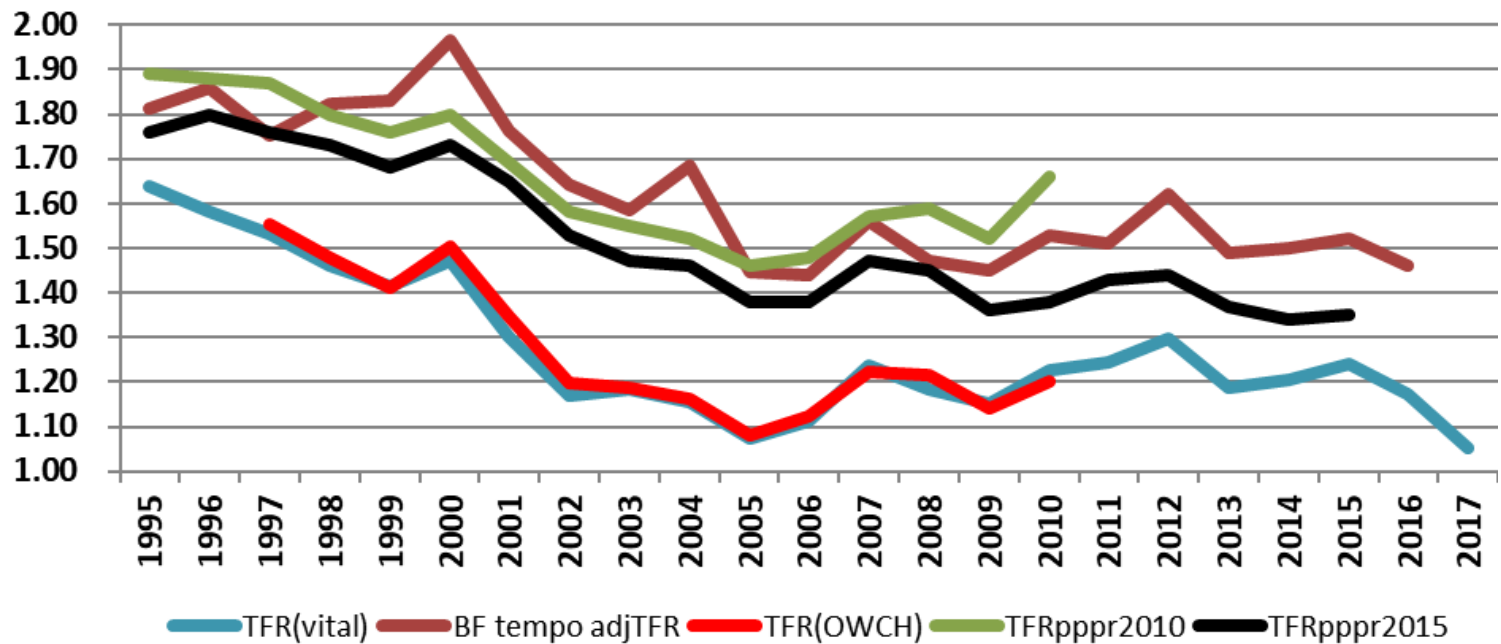

Virtual Event 15-18 June 2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

Summary : User needs

- Understanding rapid fertility decline in the Republic of Korea is a high policy priority
- Need to have accurate TFR estimate for family planning and integrating reproductive health into national strategies and health programmes

#apstatsweek2020

Virtual Event 15-18 June 2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

Summary : Data integration

- Administrative data (CRVS) and censuses are used to calculate the TFR
- Direct and indirect demographic methods (own children methods, PPRs) are used to estimate the TFR from censuses

#apstatsweek2020

Virtual Event 15-18 June 2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

Summary : Any lessons that may be relevant for other countries

- For countries without reliable CRVS, demographic methods can be used to estimate the TFR
- For countries with reliable CRVS, they can validate the quality of the CRVS and censuses

#apstatsweek2020

Virtual Event 15-18 June 2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

Summary : Dimensions of quality

- Single source of data can be biased, a mix of multiple data sources and methods are useful in validating the accuracy of TFR
- Methods presented here provide insights on current TFR of the Republic of Korea taking into account of “tempo effects” and “rates of first kind”

#apstatsweek2020

Virtual Event 15-18 June 2020

2020 Asia-Pacific Statistics Week

Leaving no one and nowhere behind

Further extension

- Using the same demographic methods presented here, TFR can be further disaggregated by education, occupation and other socioeconomic variables collected in the census
